

Abstract

A hand power tool, having a housing (12) and a tool bit (15), in particular a metal-cutting tool bit, as well as having a guard means (22), which embraces the tool bit (15) and is coupleable to the housing (12) and axially adjustable relative to it, is made easy to manipulate in setting the cutting depth by providing that the housing (12) and the guard means (22), in a first adjusting position, are positionable axially freely and in a second adjusting position, in particular guided by adjusting means, are positionable axially finely adjustably to one another, in particular lockably.
